

Oona relies on AJAX for navigation. This means you are loading only pieces of pages and not an entire HTML page on page change. By default, on page load and history change (pop state change), Oona will handle the page loading.

Enabling AJAX links

If you need to create an internal AJAX link, just make sure the href contains the following structure — `#/page`. It can also be a nested page, like so — `#/category/page`.

Styling pages

Each page will automatically acquire a proper body class, e.g. Home page will have `page-home` class or a blog post titled *Monster Beats* will have a `page-blog-mister-beats` class. This will allow you to style each page individually or use CSS regex for common elements. Example, for all blog post pages, you could use the following selector:

```
[class*='page-blog-'] { ... }
```
