

To ensure the consistency of code as well as its best practices we've decided to use linters. [ESLint](http://eslint.org) (<http://eslint.org>) for JavaScript and [scss-lint](https://github.com/brigade/scss-lint) (<https://github.com/brigade/scss-lint>) for Sass.

## **ESLint**

This linter is very powerful and configurable. Write JavaScript like a pro, ESLint will give you hints and mark obvious errors. Check out the configuration file – `.eslintrc` to see how we configured this project.

## **scss-lint**

Writing styles can be quite difficult. Do you always remember the correct order of your properties, what goes first, an `@include` or `position`? Can you track whether the rules have been rightly nested or if you've used correct spacing? `scss-lint` is the answer :relieved:

See our configuration file – `.scss-lint.yml`.
